Nucleic acids encoding 32 human secreted polypeptides, useful for preventing, diagnosing and/or treating e.g. cancers, Parkinson's preventing, diagnosing and/or trudisease and diabetic retinopathy

Claim 1; Fig 4; 890pp; English

The present sequence encodes one of 32 novel human secreted polypeptides. The nucleic acid molecules and polypeptides they encode may be used in the nucleic acid molecules and propagates they encode may be used in the nucleic acid molecules and treatment of diseases such as immune disorders (e.g. multiple sclerosis, systemic lupus erythematosus and human immuno-deficiency virus (HIV) infections), hyperproliferative disorders (e.g. Scimitar syndrome, Chaga's cardiomyopathy and coronary arteriosclerosis), andiogenic disorders (e.g. corneal graft neovascularisation and diabetic retinopathy), neurological disorders (e.g. Huntington's chorea, Alzheimer's disease and Parkinson's disease), infectious diseases and/or for promoting wound healing, regeneration and/or chemotaxis. The nucleic acid molecules may be used to produce the secreted polypeptides. They may also be used as DNA probes in disquostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples. The polypeptides may be used as antigens in the their expression and activity. expression and activity.

Isolated nucleic acid molecule encoding an inflammation-associated polypeptide is used in preventing, treating or ameliorating a medical condition

Claim 1; SEQ ID NO: 134; 859pp + Sequence Listing; English.

The present invention provides human cDNAs, proteins and related genomic DNAs. These can be used in the treatment of neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal and proliferative disorders and inflammation. The present sequence is a cDNA of the invention.

The present sequence encodes one of 32 novel human secreted polypeptides.

The nucleic acid molecules and polypeptides they encode may be used in the nucleic acid molecules and polypeptides they encode may be used in the prevention, diagnosis and treatment of diseases such as immune disorders (e.g. multiple sclerosis, systemic lupus erythematosus and human immuno-deficiency virus (HIV) infections), hyperproliferative disorders (e.g. cancers and Gaucher's disease), cardiovascular diseases.

(e.g. Scimitar syndrome, Chapa's cardiomyopathy and coronary retriosclerosis), angiogenic disorders (e.g. corneal graft neovascularisation and diabetic retinopathy), neurological disorders (e.g. Huntington's chorea, Alzheimer's diseases and Parkinson's disease), infectious diseases and/or for promoting wound healing, regeneration and/or chemotaxis. The nucleic acid molecules may be used to produce the secreted polypeptides. They may also be used as DNA probes in diagnostic sequences in samples. The polypeptides may be used as antigens in the production of antibodies and in assays to identify modulators of

Novel nucleic acid sequences encoding TANGO-128, 140, 197, 212, 213, 224 and 239 polypeptides useful for the treatment of asthma, rheumatoid arthritis, psoriasis and autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acids encoding TANGO polypeptides are useful as modulating agents for regulating cellular processes like asthma, graft versus-host diseases, rheumatoid arthritis, postiasis, inflammatory bowel disease, septic shock, ulcerative colitis, Crohn's disease, chronic myelogenous leukemia, cancer, liver disease, Hodgkin's disease, osteoarthritis, Lyme's disease, cachesta and autoimmune disease, og-myasthemia gravis, autoimmune diabetes and systemic upus erythematosus. The nucleic acids are also useful for producing transgenic animals and the TANGO polypeptides themselves. Partial TANGO-128, 140, 197, 212, 213, 239 sequences are useful in forensic biology, for diagnostic assays, prognostic assays, prognostic assays, pharmacogenomics and for monitoring clinical trials. TANGO polypeptides are suitable for both prophylactic and therapeutic methods for treating a subject at risk of a disorder or having a disorder associated with aberrant TANGO expression. A wide range
                                                                                                                                                                                                                         cachexia; autoimmune disease; myasthemia gravis; autoimmune diabetes; systemic lupus erythematosus; transgenic animal; diagnosis; prophylatic; therapeutic; human; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 atggaatgetgeegtegggeaacteetggeacactgeteetettetggettteetgete 60

Nucleic acids encoding TANGO polypeptides are useful as modulating agents for regulating cellular processes like asthma, graft versus-host diseases, rheumatoid arthritis, psoriasis, inflammatory bowel diseases, septic shock, ulcerative colitis, Crbnn's disease, chronic myelogenous leukemia, cancer, liver disease, Hodgkin's chronic myelogenous leukemia, cancer, liver disease, Hodgkin's disease, osteoarthritis, Lyme's disease, cachexia and autoimmune diseases e.g. myasthemia gravis, autoimmune diabetes and systemic lupus erythematosus. The nucleic acids are also useful for producing transgenic animals and the TANGO polypeptides themselves. Partial transcribiology, for diagnostic assays, prognostic assays, pharmacogenomics and for monitoring clinical trials. TANGO polypeptides are suitable for both prophylactic and therapeutic methods for treating a subject at risk of a disorder or having a clisorder associated with aberrant TANGO expression. A wide range of cellular disorders can be treated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    426

New human signal peptide-containing proteins useful in treatment, prevention and diagnosis of e.g. cancer, inflammation and cardiovascular disease

9; Page 321-322; 327pp; English. Claim

AAZ98109 to AAZ98242 encode AAY87224 to AAY87357 which represent the human signal peptide-containing proteins HSPP-1 to HSPP-134. HSPPs have anticancer, anti-inflammatory, antimicrobial, nootropic, hepatotropic, neuroprotective, cardiovascular and antiasthmatic activities, and can be used in gene therapy. HSPPs can be used to treat or prevent disorders associated with decreased activity or function of HSPP. Antagonists of activity or function of HSPP. Such diseases include cell proliferation (including cancer), inflammation, cardiovascular, neurological, cirrhosis, psoriasis, acquired immune deficiency syndrome, anaemia, asthma, Crohn's disease, microbial or other infections, congestive or ischaemic heart disease, Alzheimer's, Parkinson's or Huntington's diseases, schizophrenia, ovulatory defects, muscular dystrophy; Gor detecting HSPP in standard hybridisation and amplification assays (for detecting HSPP in standard hybridisation and amplification assays (for genetic variations, and for the recombinant production of HSPP, for cy genetic variations, and for chromosomal mapping. HSPP are also used to raise specific antibodyme therapeutics, for detecting related sequences or genetic variations, and for chromosomal mapping. HSPP are also used to arise specific antibodyme therapeutics, for detecting related sequences antagonists (potential therapeutic agents). Ab are used to diagnose, or mingonists; in competitive drug screens, and for purification of HSPP from antagonists.

The present invention provides human cDNAs, proteins and related genomic DNAs. These can be used in the treatment of neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal and proliferative disorders and inflammation. The present sequence is a cDNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ggagagtgactgactgagagcacccagtgctgatcctagatccccccaagtccccacaca 4137

transmembrane polypeptides and their polynucleotides, ing blood coagulation disorders, cancers and cellular useful for treating adhesion disorders secreted and

2; Fig 119; 530pp; English

The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and isorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. AA233891 to AA23438, and AA41685 to AA41774 represent polynucleotide and invention.

AAC78458 to AAC76599 represent polynucleotide and EST (expressed sequence tag) sequences which encode secreted or transmembrane PRO polypeptides. The PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bioactive molecules to cells and for modulating biological activities of cells, using the polypeptides for specific targeting. The polypeptide target cells, e.g. for the treatment of cancers. The polypeptide pairs provide specific targeting of bioactive molecules to cells. AAC78600 to AAC786987 represent PCR primers and probes used in the isolation of the PRO polynucleotide sequences.
                                                                                                                                                                                                                                                                    Novel PRO polypeptides and polynucleotides used in detection methods, to target bioactive molecules to specific cells, and to modulate cellular activities -

and Novel nucleic acids encoding PRO polypeptides, used to diagnose the presence of tumours, such as prostate and breast tumours, in mammals to screen for modulators of the compounds -

Claim 2; Fig 435; 774pp; English.

Sequences AAS45925-AAS46231 represent DNA molecules encoding and PCR primers for PRO polypeptides of the invention. The sequences of the invention can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample comparing the level of expression of a PRO polypeptide in a test sample comparing the level of expression in the test sample indicates the presence of tumour in the mammal. Mammals include dogs, cars, cattle, horses, sheep, to sed to stimulate tumour necrosis factor (TNF) alpha release from human clock, when contacted with it. A specific polypeptide can be used to proteins can be used to determine the presence of tumours and also stimulate the proliferation of differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, lung, colon, breast, prostate, rectal, cervical, or liver tumours, in mammalian conserved to the used for genetic analysis of individuals with genetic disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to murine and human ADAMTS-N (A disintegrin-like and metalloprotease domain with thrombospondin type I motifs) proteins, designated ADAMTS-5, 6, 7, 8, 9, 10 and RI. Also included in the invention are cDNA sequences encoding the proteins, and antibodies pecific for the proteins. The nucleic acid sequences and proteins may be specific for the proteins. The nucleic acid sequences and proteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate ADAMTS-N expression. Disorders that may be treated using the nucleic acids, proteins and antibodies include, for example tumour cachexia, inflammation, dermatosparaxis in cattle or Ehlers-Danlos syndrome type VIIC (EDS-VIIC) in humans, erosion of articular cartilage in arthritic (Doth inflammatory and non-inflammatory) disease, and incontrolling embryogenesis and implantation of fertilised eggs. The controlling embryogenesis and implantation of fertilised eggs. The present sequence represents CDNA encoding human ADAMTS-RI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and consequences ABB10981-ABB12330 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, constant to the polypeptides, methods of detecting the nucleotides antibodies against the polypeptides of producing the nucleotides. Con polypeptides in a sample, and methods of detecting the nucleotides of the invention and though novel, many of the polypeptides of the invention methods of detecting the nucleotides of propertides of the invention may divide an insight into their probable biological activities, and hence of polypeptides of the invention may differential therapeutic applications. The polypeptides of the invention may differential therapeutic applications. The polypeptides of the invention may differential therapeutic applications. The polypeptides of the invention may differential therapeutic applications. The polypeptides of the invention activity; activity issue growth activity; immunomodulatory activity; activity issue growth activity; immunomodulatory activity; activities; preceptor or inhibin-related activities; the invention activity activities; properties and activities or involved in onogenesis, cancer cell proliferation or metastasis.

Thrombolytic activities; receptor or liquid activities; or may been theraped activities or conditions, e.g., by protein or gene therapy. Such conditions include activity conditions (e.g., myeloid or lymphoid cell cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell cancers) and abnormal conditions, e.g., by properties involved with tissue regeneration and activities are prepared in growth. Polypeptides involved with tissue regeneration and repair growth. Factor activity may be used to promote cell growth. Factor activity ma Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject Claim 1; Page 421; 1963pp; English. 1- CAPALYTIC ACTIVITY: CLEAVES AGGRECAN AT THE 1683-GLU-1-LEU-1684
SITE, WITHIN THE CHONDROITIN SULFATE ATTACHMENT DOMAIN.
C-1- COFACTOR: BINDS 1 ZINC ION (BY SIMILARITY).
SC -1- SUBCELLULAR LOCATION: SECRETED. ASSOCIATED WITH THE EXTRACELLULAR MATRIX (BY SIMILARITY).
C-1- MATRIX (BY SIMILARITY).
C-1- MONN-REGULATED IN ENDOTHELIAL CELLS DERIVED FROM CIRRHOIT LIVER.
C-1- DOMAIN: THE SPACER DOMAIN AND THE TSP TYPE-1 DOMAINS ARE IMPORTANT FOR A TIGHT INTERACTION WITH THE EXTRACELLULAR MATRIX.
C-1- PTM: THE PRECURSOR IS CLEAVED BY A FURIN ENDOPEPTIDASE (BY SIMILARITY: BELONGS TO PEPTIDASE FAMILY MILLS.
C-1- SIMILARITY: CONTAINS 1 DISINTEGRIN-LIKE DOMAIN.
C-1- SIMILARITY: CONTAINS 3 TSP TYPE-1 DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This SWISS-PROT entry is copyright.
